Allowable Subject Matter

1. Claims **1-21** are allowed. The following is an Examiner's statement of reasons for allowance:

As per claim 1:

Independent **claim 1** of the present application teaches, for example, a method of generating a permuted data sequence based on an input data sequence, comprising: receiving the input data sequence; partitioning the input data sequence into a plurality of sections; providing each section of the plurality of sections to a different interleaver of a plurality of interleavers, wherein at least two of the plurality of interleavers are of a different type and wherein each interleaver of the plurality of interleavers generates an output based on the section provided to the interleaver; and combining the outputs from the plurality of interleavers to generate the permuted data sequence.

The foregoing limitations are not found in the prior arts of record. Particularly, none of the prior arts of record teach nor fairly suggest, *"receiving the input data sequence; partitioning the input data sequence into a plurality of sections; providing each section of the plurality of sections to a different interleaver of a plurality of interleavers, wherein at least two of the plurality of interleavers are of a different type and wherein each interleaver of the plurality of*

interleavers generates an output based on the section provided to the interleaver; and combining the outputs from the plurality of interleavers to generate the permuted data sequence". Consequently, claim 1 is allowed over the prior arts.

Dependent **claims 2-9** depend from allowable independent claims and inherently include limitations therein and therefore are allowed as well.

As per claim 10:

Independent claim 10 of the present application teaches, for example, An apparatus for generating a permuted data sequence based on an input data sequence, comprising: a buffer; a pool of interleavers coupled to the buffer; and combinational logic coupled to the pool of interleavers, wherein the buffer receives the input data sequence, partitions the input data sequence into a plurality of sections, and provides each section of the plurality of sections to a different interleaver of a plurality of interleavers in the pool of interleavers, wherein at least two of the plurality of interleavers are of a different type, wherein each interleaver of the plurality of interleavers generates an output based on the section provided to the interleaver, and wherein the outputs from the plurality of interleavers are combined by the combinational logic to generate the permuted data sequence.

The foregoing limitations are not found in the prior arts of record. Particularly, none of the prior arts of record teach nor fairly suggest, *"a buffer; a pool of interleavers coupled to the buffer; and combinational logic coupled to the pool of interleavers, wherein the buffer receives the input data sequence, partitions the input data sequence into a plurality of sections, and provides each section of the plurality of sections to a different interleaver of a plurality of interleavers in the pool of interleavers, wherein at least two of the plurality of interleavers are of*

a different type, wherein each interleaver of the plurality of interleavers generates an output based on the section provided to the interleaver, and wherein the outputs from the plurality of interleavers are combined by the combinational logic to generate the permuted data sequence”.

Consequently, claim 10 is allowed over the prior arts.

Dependent **claims 11-17** depend from allowable independent claims and inherently include limitations therein and therefore are allowed as well.

As per claim 18:

Independent **claim 18** of the present application teaches, for example, A method of generating a permuted data sequence based on an input data sequence, comprising: receiving the input data sequence; determining a subset of interleavers, from a plurality of interleavers, to be used in generating the permuted data sequence; providing the input data sequence to the subset of interleavers, wherein the interleavers produce modified output data sequences based on the input data sequence; and combining the modified output data sequences to generate the permuted data sequence.

The foregoing limitations are not found in the prior arts of record. Particularly, none of the prior arts of record teach nor fairly suggest, *“receiving the input data sequence; determining a subset of interleavers, from a plurality of interleavers, to be used in generating the permuted data sequence; providing the input data sequence to the subset of interleavers, wherein the interleavers produce modified output data sequences based on the input data sequence; and combining the modified output data sequences to generate the permuted data sequence”.*

Consequently, claim 21 is allowed over the prior arts.

Dependent claims 18-21 depend from allowable independent claims and inherently include limitations therein and therefore are allowed as well.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
